## Grouping

In Traditional paging systems, zone creation is done via hardware and is very complicated with a limit on the number of zones. Whereas with our SIP paging 100 differed zones can be created with various sets of speakers. In addition individual speakers can also be accessed by dialing their respective extn nos.
Extension Access

Speaker station creation is again very complicated in traditional systems and not many can be created. In True IPPBX technically every extension can be a speaker station but this feature restricts access to a select few extensions to avoid misuse or cause disruption.

Background Music

This feature lists all your uploaded files for background music. One can play, listen to, delete and even download from here in the event of data loss or data migration.

New music files in .wav format can also be uploaded to create a playlist for all SIP speakers and SIP IP phones.

It also allows to schedule any uploaded file on loop daily, weekly, monthly or quarterly to any extension including Public Address System extensions as well as combination of extensions simultaneously.
